**Note 5-1**: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication only when CS# is pulled Low.

**Note 5-2**: This pin (D/C#) is Data/Command control pin connecting to the MCU. When the pin is pulled HIGH, the data will be interpreted as data. When the pin is pulled Low, the data will be interpreted as

#### command.

- Note 5-3: This pin (RES#) is reset signal input. The Reset is active Low.
- **Note 5-4**: This pin (BUSY) is Busy state output pin. When Busy is High, the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin High when the driver IC is working such as:
  - Outputting display waveform; or
  - Programming with OTP
- **Note 5-5**: This pin (BS1) is for 3-line SPI or 4-line SPI selection. When it is "Low", 4-line SPI is selected. When it is "High", 3-line SPI (9 bits SPI) is selected. Please refer to below Table.

### 7-3) Panel AC Characteristics

## 7-3-1) Oscillator frequency

The following specifications apply for : VSS = 0V, VCI = 3.0V,  $T_A = 25^{\circ}C$ 

Parameter	Symbol	Conditions	Min	Тур	Max	Unit
Internal Oscillator frequency	Fosc	VCI=2.4 to 3.7V	0.95	1	1.05	MHz

### 7-3-2) MCU Interface

## 7-3-2-1) MCU Interface Selection

In this module, there are 4-wire SPI and 3-wire SPI that can communicate with MCU. The MCU interface mode can be set by hardware selection on BS1 pins. When it is "Low", 4-wire SPI is selected. When it is "High", 3-wire SPI (9 bits SPI) is selected.

Pin Name	Data/Comm	mand Interface Control Signal			
Bus interface	D1	D0	CS#	D/C#	RES#
SPI4	SDin	SCLK	CS#	D/C#	RES#
SPI3	SDin	SCLK	CS#	L	RES#

Table 7-1: MCU interface assignment under different bus interface mode

Note 7-2: L is connected to VSS

Note 7-3: H is connected to VCI

### 7-3-2-2) MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCLK, serial data SDIN, D/C#, CS#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN.

Function	CS#	D/C#	SCLK
Write Command	L	L	<b>†</b>
Write data	L	Н	<b>†</b>

Table 7-2: Control pins of 4-wire Serial Peripheral interface

Note 7-4: ↑stands for rising edge of signal

SDIN is shifted into an 8-bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock. Under serial mode, only write operations are allowed.

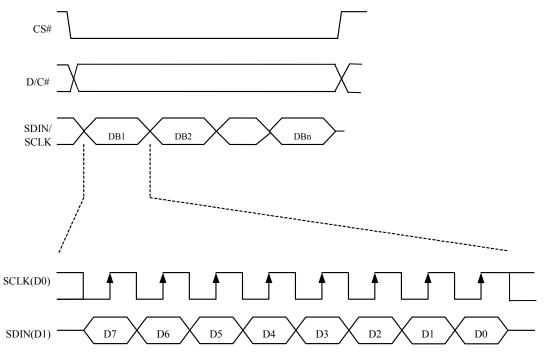

Figure 7-1: Write procedure in 4-wire Serial Peripheral Interface mode

## 7-3-2-3) MCU Serial Interface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data ADIN and CS#.

In 3-wire SPI mode,D0 acts as SCLK, D1 acts as SDIN, The pin D/C# can be connected to an external ground.

The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0). Under serial mode, only write operations are allowed.

Function	CS#	D/C#	SCLK
Write Command	L	Tie LOW	1
Write data	L	Tie LOW	1

**Note 9-2**: When work in temperature below 0 degree or above 50 degree, we do not recommend because the panel's life will not be guaranteed

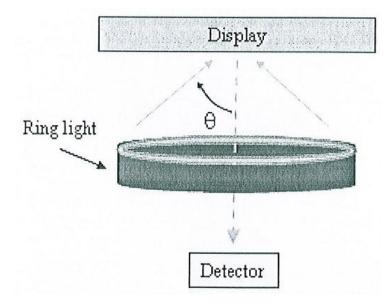

## 9-2) Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd)():

R1: white reflectance Ro

Rd: dark reflectance

CR = R1/Rd

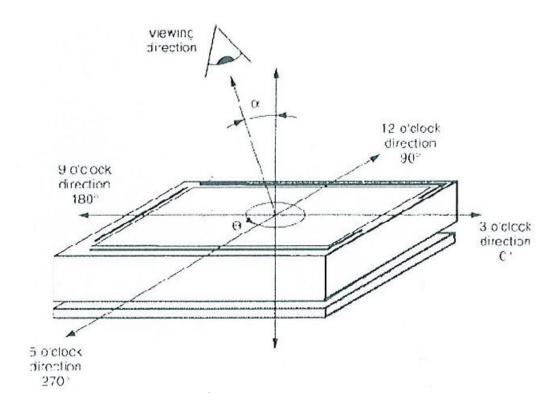

## 9-3) Reflection Ratio

The reflection ratio is expressed as:

 $R = Reflectance \; Factor \; _{white \; board} \quad x \; (L \; _{center} \; / \; L \; _{white \; board} \; )$ 

 $L_{center}$  is the luminance measured at center in a white area (R=G=B=1) .  $L_{white\ board}$  is the luminance of a standard white board . Both are measured with equivalent illumination source . The viewing angle shall be no more than 2 degrees .

## 10. HANDLING, SAFETY AND ENVIROMENTAL REQUIREMENTS

#### WARNING

The display glass may break when it is dropped or bumped on a hard surface. Handle with care.

Should the display break, do not touch the electrophoretic material . In case of contact with electrophoretic material , wash with water and soap.

#### **CAUTION**

The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components.

Disassembling the display module can cause permanent damage and invalidate the warranty agreements.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.

#### Limiting values

Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134).

Stress above one or more of the limiting values may cause permanent damage to the device.

These are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

### **Application information**

Where application information is given, it is advisory and dose not form part of the specification.
